artment of State and

What is the Problem?

O • NICTA

- Wireless Mesh Networks (WMNs)
 - key features: mobility, dynamic topology, wireless multihop backhaul
 - quick and low cost deployment
- Applications
 - public safety
 - emergency response, disaster recovery
 - transportation
 - mining
 - smart grid
 - ...
- Limitations in reliability and performance

Formal Methods for Mesh Networks

Goal

 model, analyse, verify, improve and increase the performance of wireless mesh protocols

NICTA

- develop suitable formal methods techniques

Benefits

- more reliable protocols
- finding and fixing bugs
- better performance
- proving correctness
- reduce "time-to-market"

Ad Hoc On-Demand Distance Vector Protocol

- Routing protocol for WMNs
- Ad hoc (network is not static)
- On-Demand (routes are established when needed)
- Distance-Vector
- Developed 1997-2001 by Perkins, Beldig-Royer and Das (University of Cincinnati)
- RFC by the IETF MANET working group
- basis of upcoming IEEE 802.11s

Ad Hoc On-Demand Distance Vector Protocol

- AODV control messages
 - route request (RREQ)
 - route reply (RREP)
 - route error message (RERR)

- Main Mechanism
 - if route is needed
 BROADCAST RREQ
 - if node has information about a destination UNICAST RREP
 - if unicast fails or link break is detected
 SEND RERR

UPPAAL Model Checker

- Well established model checker
- Uses networks of timed automata
- Has been used for protocol verification
- Synchronisation mechanisms
 - binary handshake synchronisation (unicast communication)
 - broadcast synchronisation (broadcast communication)
- Common data structures
 - arrays, structs, ...
 - C-like programming language
- Provides mechanisms for time and probability

Modelling AODV in UPPAAL

 Systematically derived from process-algebraic model models all parts of the official specification (except time)

NICT

- Allows interplay
- Increases trust

- Process algebra AWN
 - developed specifically for WMN routing protocols
 - easily readable
 - three necessary features: data structures, local broadcast, conditional unicast

Process Algebra AWN

Table 1 Excerpt of AWN spec for AODV. A few cases for RREQ handling.

```
\texttt{AODV}(\texttt{ip},\texttt{sn},\texttt{rt},\texttt{rreqs},\texttt{store}) \stackrel{def}{=}
 1. /*depending on the message on top of the message queue, the node calls different processes*/
 2.
      msg = rreq(hops, rreqid, dip, dsn, oip, osn, sip) \land (oip, rreqid) \in rreqs
 3.
        /*silently ignore RREQ, i.e. do nothing, except update the entry for the sender*/
 4.
        [[rt := update(rt, (sip, 0, val, 1, sip))]]. /*update the route to sip*/
 5.
        AODV(ip,sn,rt,rreqs,store)
 6.
 7. + [ msg = rreq(hops, rreqid, dip, dsn, oip, osn, sip) \land (oip, rreqid) \notin rreqs) \land dip = ip ]
        /*answer the RREQ with a RREP*/
 8.
        [[rt := update(rt, (oip, osn, val, hops + 1, sip))] /*update the routing table*/
 9.
        [rreqs := rreqs \cup \{(oip, rreqid)\}] /*update the array of already seen RREQ*/
10.
        [sn := max(sn, dsn)] /*update the sqn of ip*/
11.
        [[rt := update(rt, (sip, 0, val, 1, sip))] /*update the route to sip*/
12.
        unicast(nhop(rt,oip),rrep(0,dip,sn,oip,ip)).
13.
        AODV(ip,sn,rt,rreqs,store)
14.
15. + [msg = rreq(hops, rreqid, dip, dsn, oip, osn, sip) \land (oip, rreqid) \not\in rreqs) \land dip \neq ip \land
         (dip \notin vD(rt) \lor sqn(rt,dip) < dsn \lor sqnf(rt,dip) = unk)
        /*forward RREQ*/
16.
        [[rt := update(rt, (oip, osn, val, hops + 1, sip))]] /*update routing table*/
17.
        \llbracket rreqs := rreqs \cup \{(oip, rreqid)\} \rrbracket /*update the array of already seen RREQ*/
18.
        [rt := update(rt, (sip, 0, val, 1, sip))] /*update the route to the sender*/
19.
        \mathbf{broadcast}(\mathtt{rreq}(\mathtt{hops}+1,\mathtt{rreqid},\mathtt{dip},\max(\mathtt{sqn}(\mathtt{rt},\mathtt{dip}),\mathtt{dsn}),\mathtt{oip},\mathtt{osn},\mathtt{ip})) \ .
20.
        AODV(ip,sn,rt,rreqs,store)
21.
       [ rreg(hops, rregid, dip, dsn, oip, osn, sip) \land \dots ]
22. +
23.
        . . .
```

Table 2 Excerpt of UPPAAL model. A few cases for RREQ handling.

```
1. . . .
 2. addv \rightarrow addv {
 3. guard nextmsg()==RREQ && rreqs[msglocal[0].oip][msglocal[0].rreqid];
 4. sync tau[ip]?;
 5. assign sipupdate(), deletemsg(); },
 6. aodv \rightarrow aodv {
 7. guard nextmsg()==RREQ&&!rreqs[msglocal[0].oip][msglocal[0].rreqid]&&msglocal[0].dip==ip;
 8. sync rrep[ip][oipnhop()]!;
 9. assign updatert(msglocal[0].oip,msglocal[0].osn,1,msglocal[0].hops+1,msglocal[0].sip),
          rreqs[msglocal[0].oip][msglocal[0].rreqid]=1,
10.
          sn=max(sn,msglocal[0].dsn),
11.
          sipupdate(),
12.
          msgglobal=createrep(0,msglocal[0].dip,sn,msglocal[0].oip,ip), deletemsg(); },
13.
14. aodv \rightarrow aodv {
15. guard nextmsg()==RREQ&&!rreqs[msglocal[0].oip][msglocal[0].rreqid]&&msglocal[0].dip!=ip
          && (!rt[msglocal[0].dip].flag || msglocal[0].dsn>rt[msglocal[0].dip].dsn
           || rt[msglocal[0].dip].dsn==0);
16. sync rreq[ip]!;
17. assign updatert(msglocal[0].oip,msglocal[0].osn,1,msglocal[0].hops+1,msglocal[0].sip),
          rreqs[msglocal[0].oip][msglocal[0].rreqid]=1,
18.
          sipupdate(),
19.
          msgglobal=createreq(msglocal[0].hops+1,msglocal[0].rreqid,msglocal[0].dip,
20.
          max(msglocal[0].dsn, rt[msglocal[0].dip].dsn),msglocal[0].oip,msglocal[0].osn,ip),
          deletemsg(); },
21.
22. . . .
```

UPPAAL Model – Nodes of a Network

Each node is modelled by a timed-automaton

- Additional (local) data structure
 - routing table
 - unique name
 - ...
- Data sending via shared variables

UPPAAL Model – Topology

- Topology modelled by adjacency matrix
- Topology change by additional timed-automaton

NICTA

Synchronisation only if two nodes are connected

Experiments Set-Up

- Exhaustive search
 - different properties
 - all topologies up to 5 nodes (one topology change)
 - 2 route discovery processes
 - 17400 scenarios
 - variants of AODV (4 models)
- Larger topologies possible, but only for a few scenarios

Experiments – 3 Properties

• Route Discovery

- if two nodes are connected, does AODV find a route?
 A[]((topology.final && emptybuffers()) imply
 (node(OIP).rt[DIP].nhop!=0))
- Route Optimality
 - no non-optimal route has been established after the protocol has been terminated
- Total Optimality
 - no non-optimal route found at all

- Route discovery and route optimality do not hold
 - sanity check
 - found within seconds
 - shows power of model checking
 - route discovery (2004)
 - route optimality (2010)

Quantity Results

Potential failure in route discovery

- static topology: 47.3%
- dynamic topology (add link): 42.5%
- dynamic topology (remove link): 73.3%
- AODV repeats route request
- Other solution: Modify AODV
 - -e.g., Forward Route Reply

4 Variants of AODV

- Standard AODV
 - as reference
- Forwarding all route replies – increase the chance of route discovery
- Replying to improving requests
 - decrease number of sub-optimal routes
- Recovering from failed replies
 - further increase for route discovery
 - variant should considered with care

Experimental Results

		Property 1	Property 2	Property 3	Property 1& 2	all properties
static	model 1	52.7%	93.2%	50.7%	50.0%	13.5%
	model 2	100.0%	93.2%	47.5%	93.2%	47.5%
	model 3	100.0%	99.1%	47.5%	99.1%	47.5%
	model 4	100.0%	99.1%	47.5%	99.1%	47.5%

		Property 1	Property 2	Property 3	Property 1& 2	all properties
add link	model 1	57.5%	90.8%	49.1%	53.3%	18.1%
	model 2	100.0%	90.6%	46.2%	90.6%	46.2%
	model 3	100.0%	97.8%	46.2%	97.8%	46.2%
	model 4	100.0%	96.3%	46.2%	96.3%	46.2%

		Property 1	Property 2	Property 3	Property 1& 2	all properties
remove link	model 1	26.7%	90.5%	59.7%	26.2%	6.0%
	model 2	53.0%	89.4%	57.1%	51.2%	28.9%
	model 3	53.0%	93.1%	57.1%	52.8%	28.9%
	model 4	75.4%	94.0%	54.0%	73.8%	41.0%

UPPAAL Statistics

- Intel Core2 CPU 2.13GHz processor with 2GB RAM
- Uppaal 4.0.13.
- 70400 instances (17600 for each model)
- 4th variant (largest state space)
 - average of 9400 states
 - largest model has 475.000 states, median is 2.700
 - took on average 1.73 seconds, at most 81 seconds
- Larger topologies possible
- An automated, systematic and rigorous analysis of reasonable rich routing protocols is feasible

Further Work

- Probabilistic/Statistical Model Checking
 - equip links and topology with probabilities
 - allows quantitative analysis
- Use process algebra AWN to analyse variants – e.g. loop freedom
- Add time such as time outs to AWN and UPPAAL-model

NICTA

Automatic translation from AWN to UPPAAL

From imagination to impact
